

KEEP YOUR POULTRY FREE OF NICARBAZIN RESIDUES

Consumers do not want the poultrymeat they eat to contain avoidable residues.

Many poultry producers have recognised this fact and have taken steps to ensure that such assurances can be given.

To avoid residues of zotechnical additives in poultrymeat there is a need to take particular care when using such feedingstuffs.

HELP AVOID THESE PROBLEMS BY TAKING THE FOLLOWING STEPS

- Ensure that deliveries of feed containing nicarbazin and feed not containing nicarbazin are in accordance with the UKASTA Code of Practice for the Manufacture of Safe Compound Animal Feedingstuffs.
- Make sure that bulk bins holding feed containing nicarbazin are completely emptied out before refilling with feed not containing nicarbazin.
- Clear up any feed containing nicarbazin that is spilled into the litter.
- Do not remove birds for early slaughter when they are consuming feed containing nicarbazin.
- Always observe the Withdrawal Period specified on the feed label or that given to you by your veterinary surgeon and keep accurate records of feed and/or veterinary medicines used.
- Do not allow birds to go to slaughter until all withdrawal requirements have been met.

IF IN DOUBT CONSULT WITH YOUR FEED SUPPLIER AND VETERINARY SURGEON.
